CLAIMS

1. 1.   A method of updating information in nonvolatile memory using a controller coupled
2. to a host comprising:
3. receiving updated information organized into sectors, a plurality of sectors forming a
4. block;
5. identifying a block within the nonvolatile memory within which the updated sector
6. information is to be stored;
7. preserving un-updated sectors of information;
8. erasing the identified block; and
9. writing the updated sectors and the preserved sectors of information in the erased
10. block.
